# **NYCU-ECE DCS-2022**

HW02 Design: Visa Check Digit

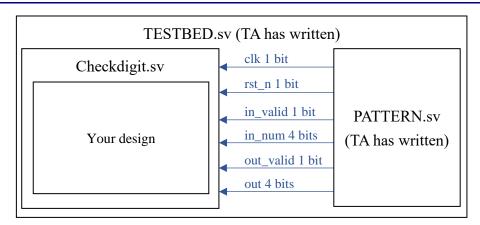

## 資料準備

1. 從 TA 目錄資料夾解壓縮:

% tar -xvf ~dcsta01/ HW02.tar

- 2. 解壓縮資料夾 HW02 包含以下:
  - a. 00 TESTBED/
  - b. 01 RTL/
  - c. 02 SYN/
  - d. 03 GATE/
  - e. 09 UPLOAD/

## **Block Diagram**

#### 設計描述

Check digit is the last digit in a number sequence. One of its applications is in banking system to protect us against inadvertent typo. (e.g. bank account number, credit card number)

## 急了! 匯錢匯錯帳戶急聯絡對方「淡水陳先生」不接電話也 不回訊

○ 5 陳彩梅 2022年2月23日 · 3 分鐘 (閱讀時間)

f 如今ATM或線上轉帳匯款都相當方便,不必先把現金領出來,就能直接進行交易,不過在匯款之前,最好多檢查匯入帳號是否正確,以免不小心匯錯款。近日就有一名網友無奈表示,

匯款給家人時,不小心按錯一個號碼,結果把錢轉進陌生人的帳戶,雖然銀行在取得對方同 意後,把電話號碼留給原PO,沒想到對方卻不接電話,傳LINE也不回,讓原PO相當焦急。 貼文一出,隨即掀起網友熱議。 Each visa credit card has 16 digits, and the last digit is the check digit. In this homework, you will receive the first 15 digits of a visa credit card. You have to calculate the last digit, i.e., the check digit according to the rule. Refer to the figure below for detailed rule and example.

(Rules from different banks may vary. We use the rule from firstbank)

## 信用卡號檢核公式

#### ▶ 權數為固定值。

卡片號碼 (Card Number) (長度:16)

發卡單位 BIN:6碼

卡片流水號 : 7碼

正附卡序號 :1碼

補發卡序號 :1碼

卡片檢查碼 :1碼,計算公式如下:

範例 1: VISA 卡片號碼: 456303-0100570-3-0-6

將上述各項值相加(若含2碼,例如12,則拆為1與2)

$$8+5+1+2+3+0+3+0+1+0+0+1+0+7+0+3+0=3$$

34取個位數4,以10減4即得檢查碼6。

The output will depend on the validity of this credit card. There are two cases:

- 1. The credit card number is valid if your answer is one digit (1-9), pull out\_valid high and output your answer.
- 2. The credit card number is not valid if your answer is two digits, pull out\_valid high and output "15" to indicate a violation.

## **Inputs**

Signal name	Number of bit	Description
clk	1	10ns clock signal
rst_n	1	Asynchronous negedge reset signal
in_valid	1	Pulled high during digit inputs
in_num	4	Random 4-bit credit card digit (0-9)

#### **Outputs**

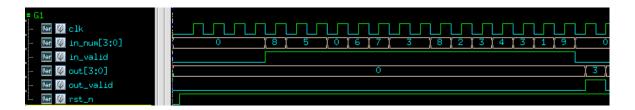

Signal name	Number of bit	Description
out_valid	1	Pulled high during check digit output
		(reset required)
out	4	Check digit output
		(1-9 for valid card, 15 for not valid card)
		(reset required)

## **Specifications**

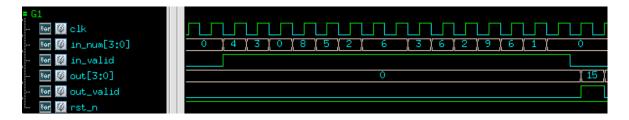

- 1. Top module name: Checkdigit (File name: Checkdigit.sv)
- 2. 在非同步負準位 reset 後,所有的 output 訊號必須全部歸零。
- 3. Output 要在 Input 結束後的 100 cycles 內輸出。
- 4. Output 僅能輸出 1 cycle,不能多不能少。
- 5. 02 SYN result 不行有 error 且不能有任何 latch。
- 6. Clock period 10 ns •
- 7. Input delay = 0.5 \* clock period; Output delay = 0.5 \* clock period
- 8. Separate your combinational and sequential blocks!

## **Example waveform**

## Case1: a valid card number, check digit is 3

## Case2: a not valid card number, output should be 15

## 上傳檔案

- 1. Code使用09\_upload上傳。
- 2. report\_dcsxx.pdf, xx is your server account. 上傳至new E3。
- 3. 請在 3/31 (四) 15:30 上課之前上傳

## **Grading policy**

- 1. Pass the RTL& Synthesis simulation. 70%
- 2. Performance 20%

Ranking formula: (total latency + number of patterns) \* area

3. Report 10%

#### Note

Template folders and reference commands:

- 1. 01\_RTL/ (RTL simulation)  $\rightarrow$  **./01**\_**run**
- 2.  $02_SYN/(synthesis) \rightarrow ./01_run_dc$
- 3.  $03\_GATE/(gate-level simulation) \rightarrow ./01\_run$
- 4.  $09\_UPLOAD/(upload) \rightarrow ./09\_upload$

報告請簡單且重點撰寫,不超過兩頁A4,並包括以下內容

- 1. 描述你的設計方法,包含但不限於如何加速(減少critical path)或降低面積。
- 2. 基於以上,畫出你的架構圖(Block diagram)
- 3. 心得報告,不侷限於此次作業,對於作業或上課內容都可以寫下。
- 4. 遇到的困難與如何解決。
